

Matrix theory Assignment 10

K R Sai Pranav

Abstract—This document explains the conversion of a matrix into both row and column reduced echelon form.

\mathbf{R}' is in row-reduced echelon form. To perform column operations, elementary matrices should be multiplied on the right side in order to convert the \mathbf{R}' into column-echelon form

$$\mathbf{R} = \mathbf{R}'\mathbf{Q} \quad (3.0.2)$$

But performing column operations on a matrix is equivalent to performing row operations on the transposed matrix.

$$\begin{aligned} \mathbf{R}^T &= (\mathbf{R}'\mathbf{Q})^T \\ \Rightarrow \mathbf{R}^T &= \mathbf{Q}^T \mathbf{R}'^T \end{aligned} \quad (3.0.3)$$

Hence, by using lemma it can be observed that \mathbf{Q}^T is invertible and of the order $n \times n$. Converting \mathbf{R}^T to row-reduced echelon is equivalent to converting \mathbf{R} to column-reduced echelon.

$$\mathbf{R} = \mathbf{P}\mathbf{A}\mathbf{Q} \quad (3.0.4)$$

\mathbf{R} in (3.0.4) is in both row and column reduced echelon form. Hence proved.

1 PROBLEM

Let A be a $m \times n$ matrix. Show that by a finite number of elementary row and/or column operations one can pass from A to a matrix R which is both row-reduced echelon and column-reduced echelon, i.e., $R_{ij} = 0$ if $i \neq j$, $R_{ii} = 1$, $1 \leq i \leq r$, $R_{ii} = 0$, if $i > r$. Show that $R = PAQ$, where P is an invertible $m \times m$ matrix and Q is an invertible $n \times n$ matrix.

2 LEMMA

Every elementary matrix is invertible and the inverse is again an elementary matrix. If an elementary matrix E is obtained from I by using a certain row or column operation q , then E^{-1} is obtained from I by the "inverse" operation q^{-1} .

3 SOLUTION

Given \mathbf{A} is a $m \times n$ matrix. Converting \mathbf{A} into row reduced echelon form by performing a series of elementary row operations \mathbf{P} . Let \mathbf{R}' be the row reduced echelon matrix. Also, by using the lemma we can tell that \mathbf{P} is invertible and order $m \times m$.

$$\mathbf{R}' = \mathbf{P}\mathbf{A} \quad (3.0.1)$$

where,

$$\mathbf{R}' = \begin{pmatrix} \mathbf{I} & \mathbf{F} \\ \mathbf{0} & \mathbf{0} \end{pmatrix}$$

\mathbf{I} is an identity matrix, \mathbf{F} is Free variables matrix and $\mathbf{0}$ represents a block of zeroes
